### **Table of classes**

Table 1: All classes and brief description

| Class       | Purpose  |
|-------------|--|
| Index.php   | This file serves as the main entry point of the application. It contains the link to all other files which the user can access and also displays existing database.              |
| Config.php  | This file contains configuration settings for the application, such as database credentials, base URLs, and other environment-specific variables.                                |
| Display.php | The purpose of this file is not clear based on the information provided. It is a file responsible for rendering specific content or data on a webpage.                           |
| Graph.php   | This file is likely responsible for generating and displaying graphs or charts based on the provided data. It utilises a graphing library or custom functions to visualize data. |
| Search.php  | This file handles the search functionality within the application. It receives user input, queries the database, and displays the search results.                                |

| Javascript.js            | This file contains JavaScript code that adds interactivity and functionality to the web pages. It handles client-side validation, AJAX requests, or other dynamic behavior and or data sorting.   |
|--------------------------|---|
| Javascriptencrypt.js     | The purpose of this file is not clear based on the information provided. It is a JavaScript file that handles encryption or cryptographic operations which has private student information.   |
| Import.php               | This file handles the process of importing data from external sources, such as Excel files, into the application's database. It contains code for reading the file, parsing data, and inserting it into the appropriate database tables.                                      |
| Style.css                | This file contains CSS code that defines the styles and visual appearance of the web pages. It controls the layout, colors, fonts, and other aspects of the user interface.   |
| Composer.json            | This file is used by Composer, a dependency management tool for PHP, to specify the project's dependencies and their versions. It defines the PHP packages that the application relies on and allows for easy installation and management of those dependencies.              |
| PHPexcel and Vendor File | PHPExcel and Vendor files: These directories contain external dependencies and libraries used by the application. PHPExcel is a PHP library for working with Excel files, and the Vendor directory typically contains Composer-installed packages and their associated files. |

Table 2: All methods and a brief description

| Method     | Description                            |
|------------|--|
| Connect()  | Establishes a connection to the        |
|            | database.                              |
| Querey ()  | Executes a SQL query on the            |
|            | database.                              |
| Fetch ()   | Retrieves a row or multiple rows       |
|            | from a database result set.            |
| Insert ()  | Inserts data into a database table.    |
| Update()   | Inserts data into a database table.    |
| Delete()   | Deletes records from a database        |
|            | table.                                 |
| Fopen()    | Opens a file for reading or writing.   |
| Fwrite ()  | Opens a file for reading or writing.   |
| Fclose()   | Opens a file for reading or writing.   |
| Echo()     | Outputs data to the browser.           |
| Includer() | Includes a separate HTML or PHP        |
|            | file in the current file.              |
| Header ()  | Sets HTTP headers for redirection      |
|            | or other purposes.                     |
| Isset()    | Checks if a form input field is set or |

|                            | has a value.                        |
|----------------------------|-------------------------------------|
| \$_POST[]                  | Retrieves data sent via HTTP POST   |
|                            | method.                             |
| \$_GET[]                   | Retrieves data sent via HTTP GET    |
|                            | method.                             |
| Jsonencode()               | Converts a PHP array or object to   |
|                            | a JSON string.                      |
| json_decode()              | Converts a JSON string to a PHP     |
|                            | array or object.                    |
| Array_Push()               | Converts a JSON string to a PHP     |
|                            | array or object.                    |
| Array_merge()              | Merges multiple arrays into a       |
|                            | single array.                       |
| generateGraphData(\$data)  | This function generates the data    |
|                            | required for creating the graph. It |
|                            | takes an array of data as input and |
|                            | returns an array of graph data.     |
| generateGraph(\$graphData) | This function generates the actual  |
|                            | graph using the provided graph      |
|                            | data. elt takes the graph data as   |
|                            | input and renders the graph on      |
|                            | the web page.                       |
| getGraphData()             | This method retrieves the data      |
|                            | from the database and prepares it   |
|                            | for graph generation. It queries    |
|                            | the database and fetches the        |
|                            | necessary data.                     |
| getStudentData()           | This method retrieves the student   |
|                            | data from the database. It queries  |
|                            | the database and fetches the        |
|                            | required information about the      |
|                            | students.                           |

#### **UML**

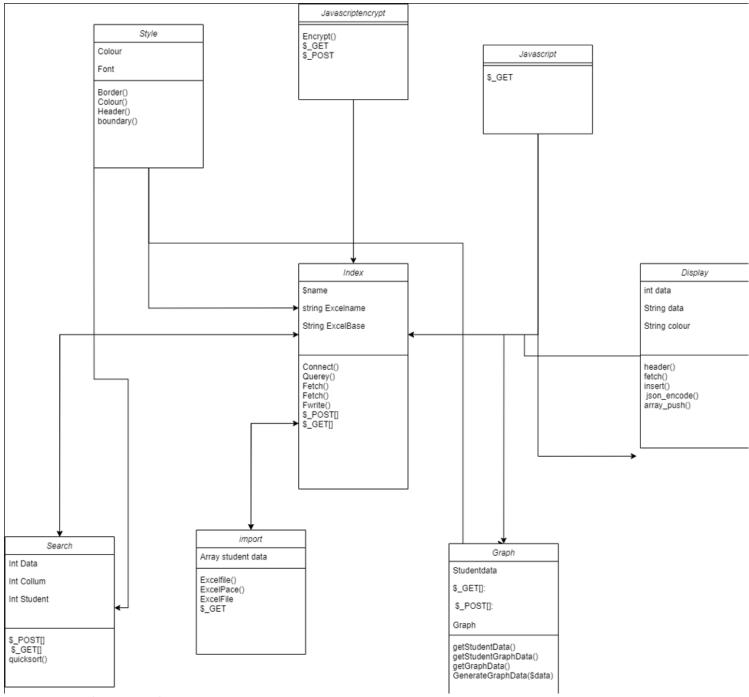

Figure 9: UML and interaction diagram

### Justification of data structures

Table 3 – Data structures

| Data structure | Data to be held                      | Justification                  |
|----------------|--------------------------------------|--------------------------------|
| MySQL          | All data(Students,grades,academic    | MySQL is an open-source        |
|                | progression, attendance, detentions) | database system that is        |
|                |                                      | reliable, fast, and easy to    |
|                |                                      | use. It is highly scalable and |
|                |                                      | can handle large amounts       |
|                |                                      | of data. It is also platform-  |
|                |                                      | independent and can be         |
|                |                                      | used on many different         |
|                |                                      | operating systems. MySQL       |
|                |                                      | is secure and offers a wide    |
|                |                                      | range of features such as      |
|                |                                      | triggers, stored               |
|                |                                      | procedures, and views to       |
|                |                                      | help developers create         |
|                |                                      | powerful applications.         |

#### **Test Plan**

Table 4: Test plan

| Test type | Description of test                | Test   | Expected outcome   |
|-----------|------------------------------------|--|--|
| 1         | Website and Database<br>Connection | Verify if the client can access the website and successfully connect to the MySQL database.  | The client should be able to access the website and establish a connection to the database without any errors.   |
| 2         | Data Display in HTML               | Check if the MySQL table data is displayed correctly on the HTML file, and if changes in the database are reflected in real-time on the webpage. | The client should see theaccurate representation of the data from the MySQL table on the HTML page, and any updates or additions to the database should be immediately visible on the webpage. |
| 3         | Excel File Import                  | Validate the functionality of importing an Excel file and adding its data to the MySQL database.   | After importing the Excel file, the client should see the data successfully added to the MySQL database without any duplication or data integrity issues.                                      |

| 4 | Double Entry<br>Prevention      | Ensure that the system prevents the client from adding duplicate data when adding new student records.   | The client should receive a notification or error message when attempting to add a student record that already exists in the database, indicating that duplicate entries are not allowed.                          |
|---|---------------------------------|--|--|
| 5 | Data Security and<br>Encryption | Evaluate the security measures implemented to protect the client's data, ensuring that it is encrypted and secure when the web files are launched                    | The client's data should be encrypted and protected from unauthorized access or manipulation, ensuring its confidentiality and integrity.  |
| 6 | Student Search<br>Functionality | Verify if the client can successfully search for a student using either their ID or name, even when multiple students have the same name.                            | The client should be able to search for a specific student using their ID or name, and the system should accurately retrieve the relevant student information, distinguishing between students with the same name. |
| 7 | Student Search<br>Functionality | Test the ability of the client to create, add, delete, and save notes for specific students, ensuring that the saved information persists and can be accessed later. | and displayed when revisiting the student's profile.   |
| 8 | Whole House Statistics          | Verify if the client can access and view comprehensive statistics and data for the entire house, based on the client's search criteria.                              | The client should be able to search for specific criteria and view relevant statistics and data in a concise and meaningful manner, providing a comp   |
| 9 | Detailed Student<br>Information | can search for a specific<br>student and view all<br>their grades and stored   | The client should be able to search for a specific student, and upon selection, view all their grades and relevant   |

|    |                       | •   | stored data in a detailed and organized format.  |
|----|-----------------------|---|--|
| 10 | Accurate Data Display | displayed on the webpages accurately reflects the data stored in the MySQL database or Excel spreadsheet. | The data displayed on the webpages should mirror the data stored in the backend accurately, ensuring consistency and reliability in the information presented to the client. |

Table 5: Record of Task

| Task Number | Planned actions                      | Planned<br>outcome  | Time estimate | Target<br>completion<br>date | Criterion |
|-------------|--------------------------------------|---|---------------|------------------------------|-----------|
| 1           | Contact with client                  | Propose the solution to the client  | 15 minutes    | 31/10/2022                   | A         |
| 2           | Meeting                              | Discuss the expectations for the produce and the requirements for satisfaction of product | 30 minutes    | 17/11/2022                   | A         |
| 3           | Discussion<br>with<br>supervisor     | To check if products plan fits into requirements  | 20 minutes    | 17/11/2022                   | A         |
| 4           | Creating a design for client         | Demonstrate<br>an idea for<br>what the<br>product will<br>look like                       | 40 minutes    | 20/11/2022                   | В         |
| 5           | Second<br>contact with<br>supervisor | Check over<br>function of<br>design and<br>demonstrating<br>idea would<br>work            | 25 minutes    | 30/11/2022                   | A         |

| 6   | Basic GUI                  | Create GUI<br>design to<br>demonstrate<br>appearance of                     | 10 minutes | 8/12/2022 | В  |
|-----|----------------------------|---|------------|-----------|----|
| 7   | Flow chart                 | code Create flow chart to show data flow and user flow                      | 35 minutes | 13/1/2023 | В  |
| 8   | UML diagram                | Shows<br>interactions   | 25 minutes | 18/1/2023 | В  |
|     |                            | between<br>classes and<br>databases   |            |           |    |
| 9   | Test plan                  | Show test cases and description of what will be tested and expected outcome | 25 minutes | 19/1/2023 | BB |
| 10  | Update UML<br>diagram      | Update the Uml<br>and system<br>overview                                    | 15 minutes | 28/1/2023 | В  |
| 11  | Second meeting with client | Learn more<br>about what the<br>client wants                                | 25 minutes | 4/2/2023  | В  |
| 12  | Update GUI                 | Update the GUI<br>and get clients<br>opinion                                | 15 minutes | 8/2/2023  | В  |
